RELATED ORGANIZATION

Description

Colour-modified carnation produced through introduction of two anthocyanin biosynthetic genes to result in a violet/mauve colouration, the dfr gene which encodes dihydroflavonol

EN

reductase and the hf1 gene which encodes flavonoid 3',5'-hydroxylase (F3'5'H) from *Petunia hybrida*. A variant form of acetolactate synthase (ALS) from *Nicotiana tabacum* was used as a selectable marker to confer tolerance to sulfonylurea herbicide.

NOTE: This LMO was formerly referred to with the UID FLO-40644-4.

Recipient Organism or Parental Organisms

The term “Recipient organism” refers to an organism (either already modified or non-modified) that was subjected to genetic modification, whereas “Parental organisms” refers to those that were involved in cross breeding or cell fusion.

Additional Information

Additional Information

These carnations were developed using recombinant DNA techniques to produce flowers with a unique violet/mauve colour by introducing two genes from petunia (*Petunia hybrida*) that function together in the biosynthesis of the anthocyanin pigment delphinidin. The transgenic lines were

derived from the parent cultivar 'White Unesco', which is a white coloured carnation that was selected for a mutation in the dihydroflavonol reductase (DFR) encoding gene that did not allow for expression of a functional enzyme, and thus did not produce the anthocyanin type pigments that give rise to blue and red coloured flowers. The two genes from *Petunia hybrida* introduced into the transgenic carnation lines included a functional dihydroflavonol reductase encoding gene (*dfr*) and a gene (*hf1*) encoding the enzyme flavonoid 3', 5'-hydroxylase (F3'5'H), a member of the NADPH-Cytochrome P450 reductase family. Expression of the F3'5'H encoding gene allows for the production of blue coloured delphinidin anthocyanin pigments, which are not normally found in carnations.

Tolerance to sulfonyl urea herbicides was produced via the introduction of a chlorsulfuron tolerant version of the acetolactate synthase (ALS) encoding gene from tobacco (*surB*).
